

# DJI Spark Propellers Replacement

How to replace your propellers of your DJI Spark to make it function and fly properly.

Written By: Uzochi Anyanwu

## INTRODUCTION

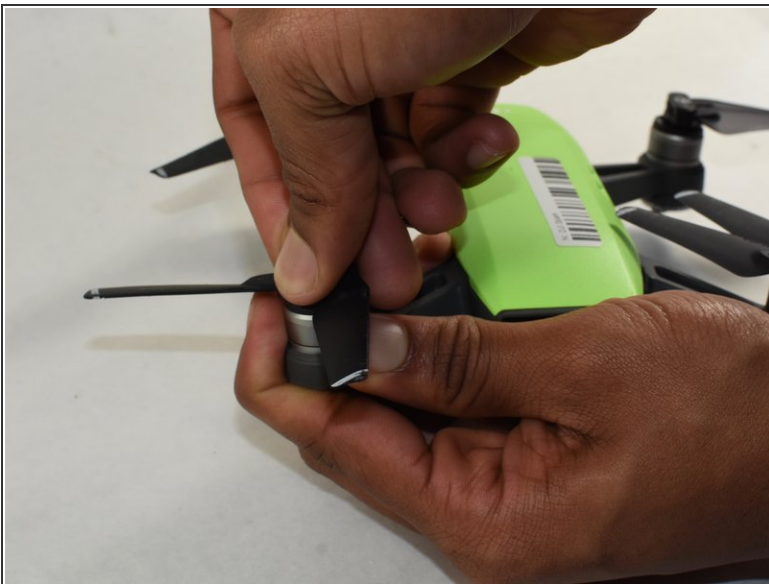

If one of the propellers on your DJI Spark (model CP.PT.000903) is damaged or missing, use this guide to replace the propeller. The propellers allow the DJI Spark to fly and move around. If the drone is incapable of flight or is only able to fly for small periods of time, it may be because the propellers have been damaged or worn down by use. Additionally, one of the propellers may have to be replaced if one has come off due to a crash or rough landing. Before using this guide, check the propellers to see if there are any visible scratches or cracks in the propellers.

## Step 1 — Propellers

- Push down on the propeller that is being replaced.

## Step 2

- Twist the propeller until it feels loose.
- Pull on it until it comes off.

To reassemble your device, follow these instructions in reverse order.
