INTRODUCTION

This guide will shows how to replace the thermal paste inside a PS4. Thermal paste is a silver liquid applied to a processor to transfer heat to a cooling solution. Thermal paste on any electronic should be replaced every couple of years or so since it will dry out.

In the PS4, the thermal paste board is right under the heat sink, and the heat sink is where most of the dust builds up. Cleaning the heat sink and replacing the thermal paste will help a PS4 run as if it was brand new. My PS4 is about six years old, and after completing this whole procedure, it quit overheating and is as quiet as a mouse. The only skills required for this task is to be able to screw and unscrew screws. It is very easy, but it is a tedious process, so pick a day when you are free if you are going to do this.

Step 1 — Remove the hard drive cover

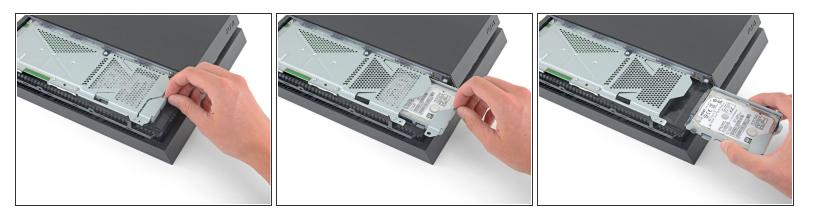

- Grip the PS4 with both hands along the gap in the top cover.
- Push the glossy side of the top cover with your thumbs until it pops to the side.
- Lift the glossy top cover up and back to remove it from the PS4.

Step 2 — Remove the hard drive bracket screw

 Use a Phillips screwdriver to remove the 6.5 mm screw securing the hard drive bracket to the enclosure.

Step 3 — Remove the hard drive bracket

• Pull the hard drive bracket out of the enclosure.

Be careful not to drop the hard drive. The internal components are fragile and are susceptible to damage by sudden shock.

Step 4 — Flip over the PS4

• Flip the PS4 upside-down with the back side facing towards you.

Step 5 — Remove the warranty stickers

 Use tweezers to remove the two stickers in the center of the back of the PS4 exposing two case screws.

Step 6 — Remove the plastic screw covers

 Use tweezers to carefully remove the plastic screw covers in each corner, exposing two more case screws.

Step 7 — Remove the rear case screws

• Remove the four 7.2 mm Torx security screws on the back of the PS4.

Step 8 — Remove the lower case

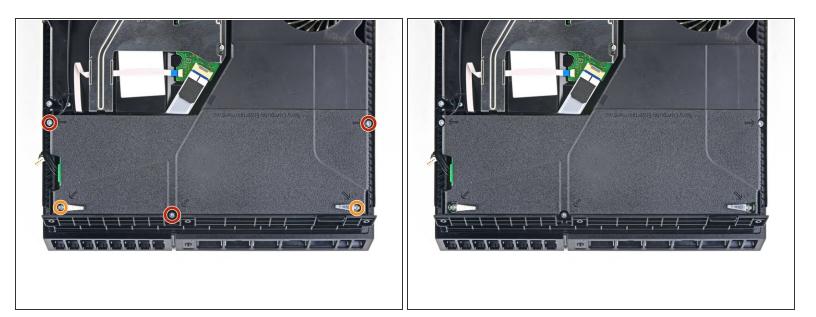

- Use your thumbs to lift the lower case up and off the PS4.
- The lower case is held into place by plastic clips. You may need to use significant force to release the lower case.

 Use a pair of tweezers to pull the power supply cable straight out and disconnect the power supply unit from the motherboard.

(i) If your connector feels stuck, use a spudger to gently pry the connector out.

Step 10 — Remove the power supply unit

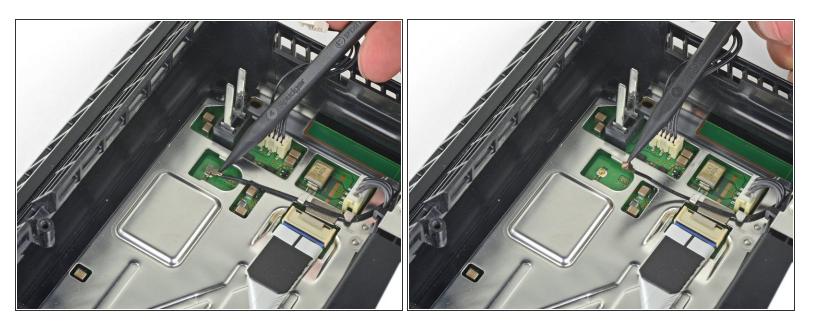

- Remove three 9.7 mm Torx security screws.
- Remove two 41 mm Phillips screws and brackets.

- Lift the power supply straight up and out of the PS4.
- (i) The power supply is held firmly in place by prongs on the left side. It may take multiple attempts to remove it.
- During reassembly, ensure the prongs are aligned, then press the power supply into place.

Step 12 — Remove the Wi-Fi antenna

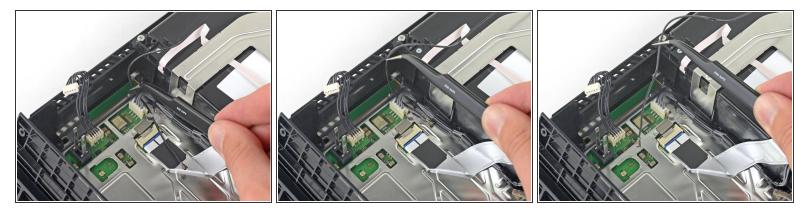

• Use the tip of a spudger to disconnect the antenna cable from the motherboard.

 Use a pair of tweezers or your fingers to grab the antenna cable and move it out from the cable guides.

Step 14

 Use a pair of tweezers or your fingers to thread the antenna cable out from underneath the optical drive cable.

• Remove the 9.7 mm Torx security screw securing the antenna.

Step 16

• Remove the Wi-Fi antenna.

Step 17 — Disconnect the optical drive

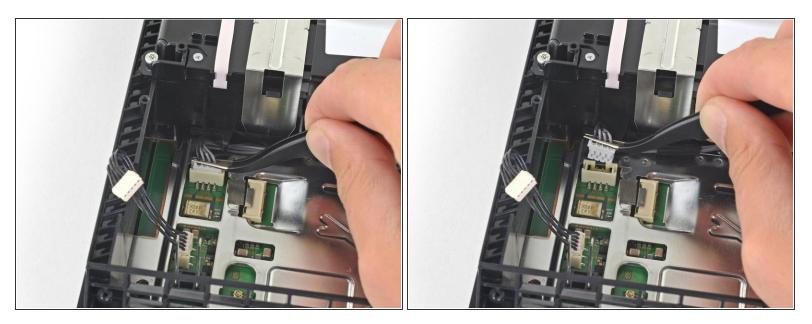

- Use your fingernail to press down on the metal release lever of the ribbon cable on top of the optical drive.
- Use your fingers or a pair of tweezers to disconnect the ribbon cable by pulling on the black tab.
- You do not need to press the metal lever when inserting the ribbon cable back in. You will hear a click once it is fully inserted.

Step 18

- Use your fingernail to press down the metal release lever for the ribbon cable connected to the motherboard.
- Use your fingers or a pair of tweezers to disconnect the ribbon cable by pulling on the black tab.
- Set the ribbon cable aside for reassembly.
- You do not need to press the metal lever when inserting the ribbon cable back in. You will hear a click once it is fully inserted.

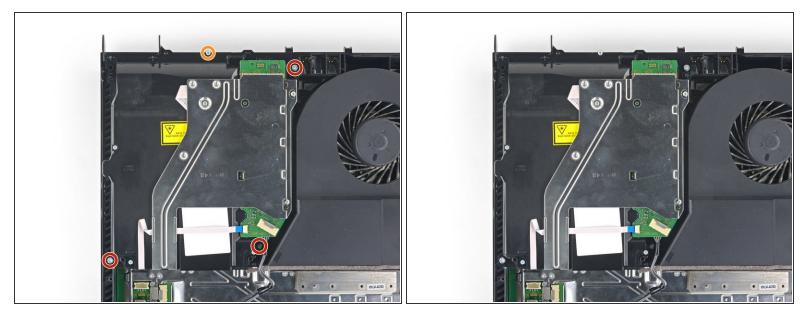

• Use your fingers or a pair of tweezers to disconnect the optical drive cable from the motherboard.

Step 20

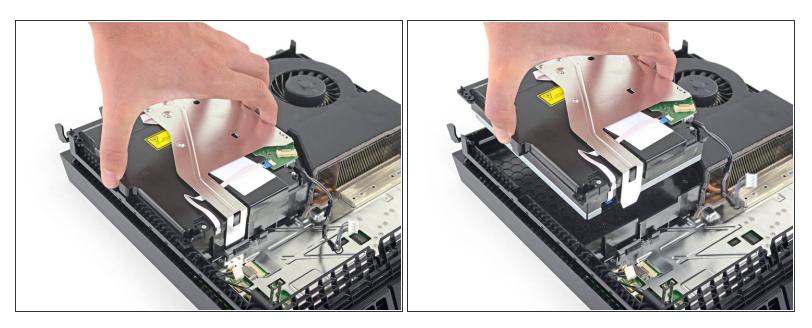

• Use your fingers or a pair of tweezers to remove the optical drive cable from the cable guides that hold it in place.

Step 25 — Remove the upper EMI shield

• Remove the twelve 9.7 mm Torx screws securing the upper EMI shield.

Step 26

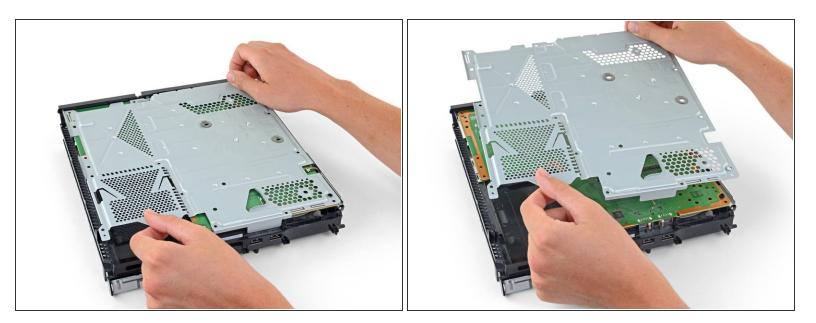

- This step shows you how to properly unscrew the pressure plate.
- Remove the two 15.6 mm Phillips screws.
 - Gradually unscrew the pressure plate by turning each screw one half turn at a time.
 - Alternate between the two screws to maintain even pressure on the pressure plate.

Do **not** unscrew one side completely before unscrewing the other side or you may damage the processor.

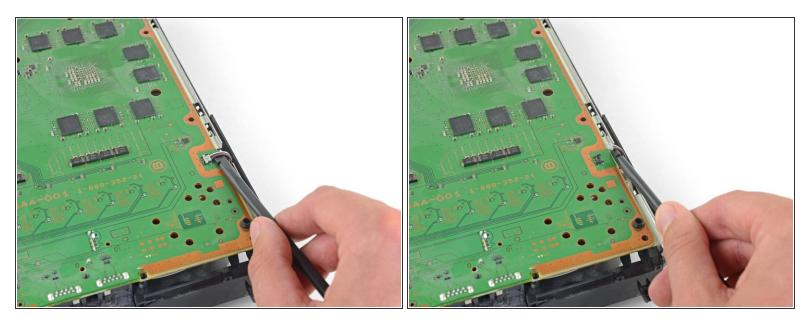

• Remove the pressure plate.

Step 28
