INTRODUCTION

This guide explains the procedure that is necessary to repair a loose headphone jack. If you experience interrupted sound coming out of one headphone or sound coming only out of one headphone this guide may be the solution to your problem.

TOOLS:

- [iFixit Opening Picks set of 6](#) (1)
 - [Solder](#) (1)
 - [Soldering Iron](#) (1)
-

Step 1 — Open the case

⚠ Before you start remove a possibly inserted flash card!

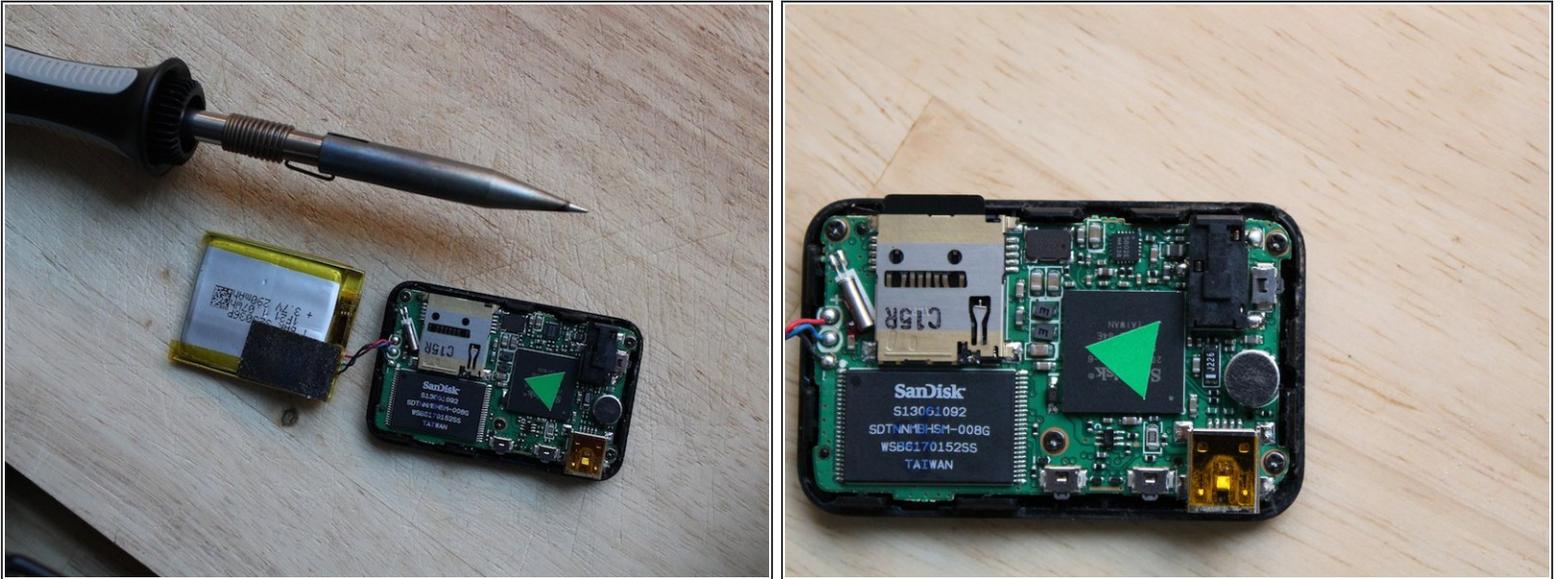

- Gently, insert a guitar pick (or a similar plastic pry tool) into the upper right corner of the Clip+ between the two case halves.
- **i** Be careful as the plastic is prone to scratches. Only use slight force.
- With the guitar pick inserted into the two case halves make your way around the edges of the case.
- The plastic noses will come off easily.

Step 2

- Carefully lift up the battery which is glued to a memory chip.
 - ⚠ The battery is wired to the mainboard. Be careful to not rip the wires.
- Identify the three soldering points around the headphone jack that are shown in the second picture. It is likely that at least one of them got loose.

Step 3

- Take a thin soldering iron and heat up the soldering points one by one.
 - ⚠ Be careful to not touch any other parts on the mainboard with the soldering iron.
- After soldering the headphone jack should sit tight on the mainboard.
- Finally, take your preferred headphones and test the result.

To reassemble your device, follow these instructions in reverse order - of course without de-soldering.
